

Fetal Bovine Serum

> Your cells will feel the difference

IgG Depleted

Some experiments require low levels of specific antibody. Fetal bovine serum (FBS) has natural levels of IgG that are too high for some cell culture applications. Biowest can offer you a perfect alternative without changing the performance of FBS.

- Performance is equivalent to non-treated FBS
- Ultra low IgG levels < 5 µg/ml
- No modification on the cell growth promotion
- No modification on the cell viability
- Ideal solution for cell culture and protein purification applications where naturally occurring levels of IgG are too high

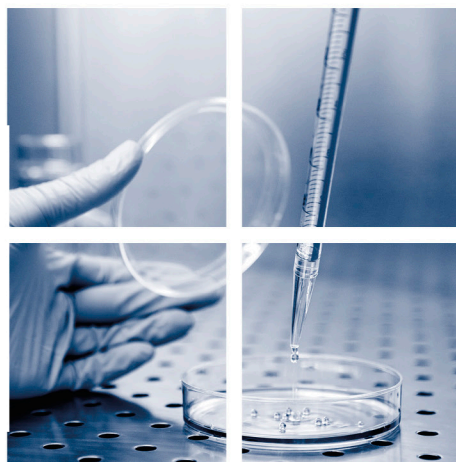

FBS IgG depleted has been treated with proprietary chromatography method. This treatment reduces the level of IgG.
